

Feeding the Soil

Cape Cod National Seashore

National Park Service
U.S. Department of the Interior

Molasses, Kelp, and Soy

There is a good reason the natural products in use on the tee, fairway, and green of the first hole at Highland Links sound like menu items, not chemicals. Healthy soil is a living system that needs to be fed.

Feeding the soil builds a healthy turf ecosystem able to withstand the pressures of heavy usage, insects, weeds, and disease as well as drought and heat. Instead of treating symptoms, natural turf management grows robust grass from the ground up.
